Emiota, a French startup, has introduced stylish wearable device Belty Good Vibes. This belt claims to be the first smart connected product that integrates artificial intelligence to promote a healthy lifestyle. Good Vibes learns and tracks your activity level and can provide feedback on your activity, stress, or any habit you wish to establish, such as drinking more water.

The belt communicates to the wearer in real-time by vibrating. Let’s say you have sat at your desk too long. Good Vibes gives you a little vibration to remind you to get up and walk around. You do not need the phone to communicate with your belt - just tap. The Belty sister app allows you to view your history and customize the feedback you wish to receive.

Each belt is made in France from high-end, hand stitched leather. You never have to worry about the leather going out of style; the “brain” of the belt is in the buckle, so the leather may be changed. It seems Good Vibes can be a stylish way to track your activity, and a good friend to help you establish new habits. The launch is currently planned for December 2016.
